Make RDS not copy logs to system log🔗

Feature HSBC-3152

Also In: 2.8.3 2.9.2

The Reference Data service was copying its request logs into the system logs (`/var/log/messages`) by default. This was controlled by the undocumented `reference_data_log_console` variable, which was set to `true` by default. We've set this to `false` in the `project-default` Ansible configuration.

The request log will instead go to the `request.log` file in the normal reference data log folder, and will be rotated and compressed daily, with 5 compressed files. We do not expect that this file will need to be exported to stackdriver.
