Schema Mapping

This page contains comma-separated value (CSV) files that allow you to confirm where API fields are used. Among other parameters, these CSVs contain rules, metrics, and variables from Payments.

As a business analyst, you need to understand the impact of missing data fields on your client's data. As such, the following files allow you to:

- Validate the API fields required to run each rule (e.g. fields in a rule's condition and metrics).
- Confirm where an API field is being used in the whole solution (e.g. in which metrics, rule conditions, or variables).
